

MUHAMMAD NAIMI NAFIS BIN NORLISAM

Kyoto, Japan | (+81) 070-9020-7072 | naimishuushoku@gmail.com | [GitHub](#) | [LinkedIn](#) | [Portfolio](#)

SUMMARY

Full-stack developer and graduate researcher at Kyoto Institute of Technology. Built 2 web apps and 2 browser extensions in Python/Flask and React, including a hackathon-winning music discovery extension (3rd of 24 teams, Giiku CAMP Vol. 6, 2025). Comfortable across backend, frontend, and Linux/macOS tooling, and excited to grow as an engineer in a collaborative, Japanese and English-speaking environment.

EDUCATION

Kyoto Institute of Technology | M.S. Computer Science & Engineering Apr 2026 – Mar 2028 (current)
Master's program, Intelligent Software Engineering Laboratory (KIT-ISEL). Research: SE + AI.

Kyoto Institute of Technology | B.Eng. Information Science Apr 2022 – Mar 2026

University of Malaya | Pre-University Program (AAJ) Apr 2020 – Mar 2022
Special Preparatory Program to Enter Japanese Universities (AAJ).

TECHNICAL SKILLS

Spoken Languages: Malay (Native), English (Native), Japanese (JLPT N2), TOEIC 965

Programming Languages: Python, JavaScript, Dart, Java, C, Ruby

Frameworks & Libraries: React, Flutter, Flask, SQLite, HTML5/CSS3

Tooling: Docker, Git, GitHub, Linux, macOS

EXPERIENCE

Intelligent Software Engineering Laboratory (KIT-ISEL) Apr 2025 – Present
Graduate Researcher | LLM-based Code Detection and Analysis Kyoto, Japan

- Built and currently operate a face-recognition lab admission web app (ArcFace + RetinaFace) serving 10+ lab members, with a Flask + SQLite backend and an HTML/CSS/JS frontend deployed on an in-lab Ubuntu server.
- Designed a Python evaluation pipeline to benchmark current LLM-generated code detectors (CodeGPTSensor, DetectCodeGPT, DroidDetect) against code obfuscations such as identifier renaming, surfacing measurable accuracy drops across all three detectors; containerized with Docker for reproducible runs on the lab server.

PROJECTS

Lyrika: Music Discovery Browser Extension | [GitHub](#) July 2025
3rd Place, Giiku CAMP Vol. 6, 2025 (24 teams)

- Built a browser extension with a JavaScript frontend and Python Flask backend that identifies songs in real time and surfaces lyrics and AI-generated context.
- Integrated ACRCLOUD, Genius, and Gemini APIs with async calls so recognition, lyrics, and AI insights load in parallel without freezing the UI.

QRious: QR Utility App | [GitHub](#) June 2025
KIT-ISEL 2025 Hackathon

- Built a Flutter iOS app that scans QR codes and checks URLs for safety entirely on-device, so it works offline and keeps user data private. Structured with Flutter's Provider for clean separation of UI, logic, and data layers.

Readoku: Japanese Translation Browser Extension | [GitHub](#) May 2025
TrackJob 5/2025 Hackathon

- Built a browser extension that translates selected Japanese text in-context on any webpage, so learners can read native content without switching tabs.
- Added response caching and request batching to cut average translation time by 30% versus the first prototype.

EXTRACURRICULAR ACTIVITIES

M(ulticultural) Café | **Kyoto Institute of Technology** Apr 2025 – Present
Communication Facilitator. Run weekly language-exchange sessions for ~6 Japanese and international students.
